CERTIFICATE

Date:___/___/_____

This is to certify that **Mr.** ***Priyanshu Kachiya,*** **Mr.** ***Rudra Dobariya,*** **Mr.** ***Rudra Barot,*** **Mr.** ***Rudra Thakkar*** **And Mr.** ***Rushi Pradhan*** from LJ POLYTECHNIC having Enrollment No. ***22012250210337, 22012250210368, 22012250210369, 22012250210371 And 22012250210373*** have completed project documentation and fully development on the problem definition of semester VI during the academic year 2024-25 having Title ***Leaf-Village*** in a group consisting of 5.

Institute Guide **Head of the Department**

ACKNOWLEDGEMENT

We would thank God for being able to complete this project with success. Then We would like to thank our faculty whose valuable guidance has been the ones that helped us patch this project and make it full proof success his suggestions and his instructions has served as the major contributor towards the completion of the project. Secondly, we would also like to thank our parents who supported in our project.

Priyanshu Kachiya (22012250210337)

Rudra Dobariya (22012250210368)

Rudra Barot (22012250210369)

Rudra Thakkar (22012250210371)

Rushi Pradhan (22012250210373)

ABSTRACT

This project involves developing an e-commerce website dedicated to selling plants and gardening supplies. The platform offers a diverse range of indoor and outdoor plants, seeds, pots, and gardening tools, catering to both novice and experienced gardeners. Users can browse products, read detailed descriptions, and receive personalized recommendations based on their preferences and climate. The site also features a blog with tips on plant care and landscaping. With a focus on sustainability and eco-friendly practices, the website aims to promote greenery and nature-friendly lifestyles, making gardening accessible to all.

CHAPTER-1
INTRODUCTION

1.1 Need Of The Website

- The website on e-commerce is needed in that it will make the buying of plants easy and convenient. One can shop while at home, with numerous types of plants to choose from and in-depth information about the care of the plant.
- The website can offer professional tips, subscription options for regular plant deliveries, and customizable orders with options such as eco-friendly choices. All in all, this will make it easier for them to search for and buy plants; that is, more accessible and efficient for the lovers of plants.

1.2 Detailed Problem Definition

- Many local stores in towns or cities can barely sell a certain range of plants, often excluding rare or exotic species that customers might be interested in. This makes it infuriating for any sort of plant enthusiast who wants to look for specific species or any different kinds of plants.
- Shopping for plants in physical stores is a big waste of time. In addition, he must travel to various shops to get the plants of their choice, manage according to shop timings, and handle the traveling hassle. A user friendly front-end for the user to interact with the system.

- Plant delivery includes several other issues concerning the perfect packaging, maintenance of shipping conditions, and scheduled delivery. All these issues may further cause damage to the plants and make delays in deliveries, lowering customer satisfaction.

1.3 Viability Of The System

- First and foremost, it is market demand. People are becoming increasingly interested in plants for fashion trends in interior design, sustainable living, and individual health. This market demand needs to be understood; you would like to make certain that there is huge and continuous interest in buying plants and related products online.
- Here, there may be established players in the e-commerce plant market, so it is required of you to research the existing competition. Scrutinize the rival's strengths and weaknesses for opportunities where you can delineate your website.

1.4 Presently Available Website

- https://www.santhionlineplants.com
- The site offers a diverse selection of plants, including indoor plants, outdoor plants, flowering plants, and succulents.

1.5 Future prospects

- Growing consumer preference for convenient online plant shopping.
- Enhanced Website.
- Personalized shopping experiences and advanced customer support tools.

CHAPTER-2
ANALYSIS

2.1 Requirement Analysis

User Roles

- **Admin** - Manage products (add, edit, delete). View, process, and update orders. Manage user accounts (view, delete). View analytics and sales reports.
- **Customer** - Browse product categories. View product details and reviews. Add products to the shopping cart. Purchase products using different payment methods. Leave product reviews.

Product Management

- **Product Information** - Product name, description, price, size. Stock availability. Care instructions (water, sunlight, fertilizer requirements). Customer ratings and reviews.

Order Management

- **For Customers** - Add/remove products from the cart. Checkout process (address, payment, review order).
- **For Admin** - View all orders (pending, completed, shipped). Update order statuses (pending, processing, shipped, delivered).

Payment System

- Secure payment integration (e.g., PayPal, cash on delivery). Apply discount codes, coupons, or offers. Support for multiple currencies (optional, if international shipping is provided).

Reviews and rating

- Customers can leave reviews and star ratings on products they purchase. Reviews should be displayed on the product detail page. Admin should be able to moderate reviews (approve/delete inappropriate reviews).

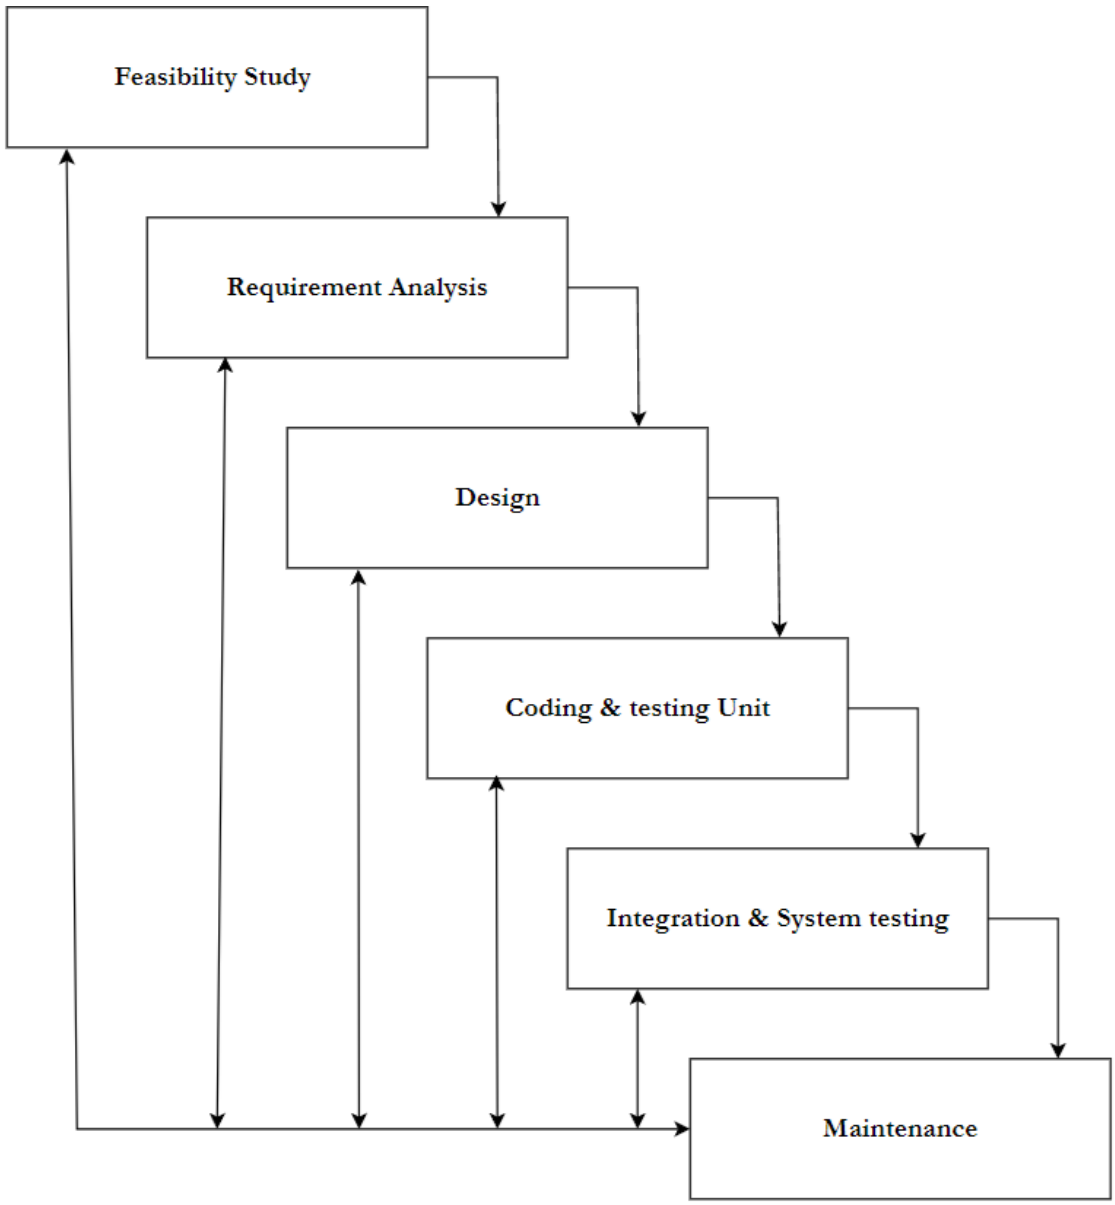
Customer Support

- FAQ section for common questions regarding plants and gardening care. Return/refund policies.

User Account Management

- User registration and login (email/password, social media login). Profile management (update name, email, password, delivery addresses).

2.2 Project Model



[Figure 1: Iterative Waterfall Model]

- This application is developed using Iterative model. Almost every other model is derived from the waterfall model.
- The phase of detecting errors is close to its points of introduction is known as face containment of errors.

- Incremental model is also referred as the successive version of waterfall model using incremental approach and evolutionary model.
- In this model, the system has broken down into several modules which can be incrementally implemented and delivered.
- First develop the core model and when customer evaluate the system then the initial product skeleton is redefined into increasing levels capacity by adding new functionalities in successive versions.

Advantages

- Each successive version performing more useful work than previous versions.
- The core modules get tested thoroughly, thereby reducing change of error in final product.
- The model is more flexible and less costly to change the scope and requirement.
- User gets a change to experiment with partially developed software.
- This model helps finishing exact user requirements.
- Feedback providing at each increment is useful for determining the better final product.

2.3 Schedule Representation

Generalized project scheduling tools and technique can be applied with little modification to software projects.

Project evolution and review technique and critical paths method are two project scheduling method that can be applied to software development. Both techniques are driven by information already developed in earlier project planning activities:

- A decomposition of the product function.
- The selection of appropriate process model and task set.
- Estimate of effort.
- Decomposition

[Table 1: Schedule Representation]

System Coding		
Testing and Integration		

2.4 Feasibility Study

2.4.1 Technical Feasibility

- The proposed system will be developed in web bases completely and it is required to use web technologies appropriately. Technology to build the overall system is available.
- Currently Available web technology - HTML, CSS, JavaScript (front-end) and Python (Django/Flask), Node.js (back-end).

- Servers – pyhtonanywhere
- DBMS – MySql

2.4.2 Economical Feasibility

- Economic feasibility is the most frequently used method for evaluating the effectiveness of a new system. More commonly known as cost/benefit analysis, the procedure is to determine the benefits and savings that are expected from a candidate system and 8 compare them with costs. If benefits outweigh costs, then the decision is made to design and implement the system.

2.4.3 Operational Feasibility

- Definition: Operational feasibility assesses how effectively a proposed system addresses the identified problems and leverages opportunities from the scope definition and problem analysis phases, and how well it satisfies the system requirements from the requirement analysis phase.
- User Familiarity: The potential users of the Plants and Greenery e-commerce website will be familiar with basic web navigation and interaction, making the training process straightforward and efficient. Basic training on managing products, processing orders, and using admin functionalities will be sufficient for most users.
- Data Security: The system will include robust security features by implementing multiple access levels for various users (e.g., admin,

vendor, customer). Secure authentication, authorization, and auditing procedures will be in place to safeguard sensitive data and provide system administrators with full control over the site's operations.

- Data Management: Data retrieval for products, customer details, and orders will be efficient. Advanced querying mechanisms, search filters, and backend database management systems (such as MySQL or SQLite) will ensure quick and smooth data access.

CHAPTER-3
DESIGN

3.1 Data Flow Diagram

- DFD (data flow diagram) is also known as bubble chart or data flow graph.
- DFD's are very useful in understanding the system and can be effectively used during analysis. It shows flow of data through a system visually. The DFD is a hierarchical graphical model of a system the different processing activities or functions that the system performs and the data interchange among these functions.
- It views a system as a function that transforms the inputs into desired output.
- Each function is considered as a process that consumes some input data and produces some output data.
- Function model can be represented using DFD.
- DFD graphically representing the functions, or processes, which capture, manipulate, store, and distribute data between a system and its environment and between components of a system.
- The visual representation makes it a good communication tool between User and System designer.
- Structure of DFD allows starting from a broad overview and expand it to a hierarchy of detailed diagrams.
- DFD has often been used due to the following reasons:
  1. Logical information flow of the system.
  2. Determination of physical system construction requirements.

3. Simplicity of notation.
4. Establishment of manual and automated systems requirements.

[Table 2: Data Flow Diagram Symbols]

Symbols	Description
	Entity: Entities are external to the system which interacts by inputting the data.
	**System:** It shows the system name.
	**Process:** It shows the part of the system that transforms into outputs.
	Data Flow: It passes the data from one part to another.
	Data Store: Data store is represented by two parallel lines. It is generally logical file or database.

3.2 ER-Diagram

An Entity Relationship (ER) Diagram is a type of flowchart that illustrates how “entities” such as people, objects or concepts relate to each other within a system. ER Diagrams are most often used to design or debug relational databases in the fields of software engineering, business information systems, education and research. Also known as ERDs or ER Models, they use a defined set of symbols such as rectangles, diamonds, ovals and connecting lines to depict the interconnectedness of entities, relationships and their attributes. They mirror grammatical structure, with entities as nouns and relationships as verbs.

[Table 3: ER-Diagram Symbols]

Symbols	Description
	Entity: Data object is real world entity or thing. It is represented by a rectangle shape. An entity is an object or concept about which you want to store information.
	**Attributes:** An attribute is property of characteristic of an entity. It is represented by oval shape.
	**Relationship:** Entity are connected each other via relations. Generally, relationships in binary because there are two entities are related to each other.
	**Cardinality (One to One):** An instance of entity A can relate to one instances of entity B.
	**Cardinality (One to Many):** An instance of entity A can relate to one or many instances of B but we can only relate one instance of A.
	**Cardinality (Many to One):** One or more instances of entity A can relate to one instances of B.
	**Cardinality (Many to Many):** One or more instances of entity A can relate to one more instance of entity B.

CHAPTER-4

SYSTEM MODELING

4.1 Database Dictionary

1. Table Name: head_admin

Primary Key: head_admin_id

[Table 4: head_admin]

SR NO.	FIELDNAME	DATATYPE (SIZE)	CONSTRAINT	DESCRIPTION
1	head_admin_id	INT(5)	Primary Key	Unique identifier for each admin.
2	username	VARCHAR (255)	Unique Key	Username of the user.
3	email	VARCHAR (255)	Unique Key	Email address.
4	password	VARCHAR (255)	Unique Key	Password for securtiy.

2. Table Name: products

Primary Key: product_id

[Table 5: products]

SR. NO	FIELDNAME	DATATYPE (SIZE)	CONSTRAINT	DESCRIPTION
1	product_id	INT(3)	Primary Key	Unique identifier for each product.
2	category	VARCHAR (255)	Not Null	Category of the product.
3	subcategory	VARCHAR (255)	Not Null	Subcategory of the product.
4	image_url	TEXT	Not Null	URL of the product image.
5	steps_to_grow	TEXT	Not Null	Guide on how to grow the plant.
6	product_name	VARCHAR (255)	Not Null	Name of the product.
7	description	TEXT(255)	Not Null	Detailed description of the product.
8	price	DECIMAL (10,2)	Not Null	Price of the product
9	stock_quantity	INT(3)	Not Null	Quantity available in stock.

3. Table Name: orders

Primary key: order_id

Foreign Key: user_id

[Table 6: orders]

SR. NO	FIELDNAME	DATATYPE (SIZE)	CONSTRAINT	DESCRIPTION
1	order_id	INT(10)	Primary Key	Unique identifier for each order.
2	user_id	INT(5)	Foreign Key	User who placed the order.
3	shipping_address	TEXT	Not Null	Shipping address for the order.
4	razorpay_order_id	VARCHAR (255)	Not Null	Razorpay order ID.
5	razorpay_payment_id	VARCHAR (255)	Not Null	Razorpay payment ID.
6	razorpay_signature	VARCHAR (255)	Not Null	Razorpay signature for validation.
7	order_date	DATE/ TIME	DEFAULT CURRENT_TIMESTAMP	Timestamp when the order was placed.
8	total_price	DECIMAL(10,2)	Not Null	Total price of the order.
9	shipping_price	TEXT(255)	Not Null	Shipping address for this specific order.
10	order_status	ENUM('Pending', 'Shipped', 'Delivered', 'Cancelled')	Not Null	Status of the order.
11	Payment_method	ENUM('Pending', 'Completed', 'Failed')	Not Null	Payment status of the order.

4. Table Name: order_items

Primary Key: id

Foreign Key: order_id, product_id

[Table 7: order_items]

SR. NO	FIELDNAME	DATATYPE (SIZE)	CONSTRAINT	DESCRIPTION
1	id	INT(10)	Primary Key	Unique identifier for each order item.
2	order_id	INT(10)	Foreign Key	Order to which the item belongs.
3	product_id	INT(5)	Foreign Key	Product being ordered.
4	quantity	INT(3)	Not Null	Quantity of the product ordered.

5. Table Name: shopping_cart

Primary Key: cart_id

Foreign Key: user_id, product_id

[Table 8: shopping_cart]

SR. NO	FIELDNAME	DATATYPE(SIZE)	CONSTRAINT	DESCRIPTION
1	cart_id	INT(3)	Primary Key	Unique identifier for each cart item.
2	user_id	INT(5)	Foreign Key	User who owns the cart.
3	product_id	INT(3)	Foreign Key	Product added to the cart.
4	quantity	INT(5)	Not Null	Quantity of the product added to the cart.

6. Table Name: payment

Primary Key: payment_id

Foreign key: order_id

[Table 9: payment]

SR. NO	FIELDNAME	DATATYPE(SIZE)	CONSTRAINT	DESCRIPTION
1	payment_id	INT(10)	Primary Key	Unique identifier for each payment.
2	order_id	INT(10)	Foreign Key	Order for which the payment was made.
3	amount	DECIMAL (10,2)	Not Null	Total amount paid.
4	payment_method	ENUM('Pay Pal', 'Cash on Delivery')	Not Null	Method used for the payment.
5	Payment_status	ENUM('Pen ding', 'Completed', 'Failed')	Not Null	Status of the payment.

7. Table Name: messages

Primary key: message_id

[Table 10: messages]

SR. NO	FIELDNAME	DATATYPE (SIZE)	CONSTRAINT	DESCRIPTION
1	message_id	INT(10)	Primary Key	Unique identifier for each review.
2	user_name	VARCHAR (255)	Not Null	Name of the user sending the message.
3	user_email	VARCHAR (255)	Not Null	Email of the user sending the message.
4	user_message	TEXT(255)	Not Null	Message content sent by the user.
5	created_at	TIME STAMP	DEFAULT CURRENT_TIMESTAMP	Timestamp when the message was created.

8. Table Name: shipping

Primary Key: shipping_id

Foreign Key: order_id

[Table 11: shipping]

SR. NO	FIELDNAME	DATATYPE (SIZE)	CONSTRAINT	DESCRIPTION
1	shipping_id	INT(10)	Primary Key	Unique identifier for each shipping record.
2	order_id	INT(5)	Foreign Key	Order associated with the shipping.
3	shipping_address	TEXT(255)	Not Null	Address to which the order is shipped.
4	shipping_status	ENUM('Pending', 'In Transit', 'Delivered')	Not Null	Shipped status.

9. Table Name: user

Primary Key: user_id

[Table 12: user]

SR. NO	FIELDNAME	DATATYPE (SIZE)	CONSTRAINT	DESCRIPTION
1	user_id	INT(5)	Primary Key	Unique identifier for each user.
2	username	VARCHAR (225)	Not Null	Full name of the user.
3	email	VARCHAR (255)	Unique Key	Email address.
4	password	VARCHAR (255)	Not Null	Hashed password for security.
5	phone	VARCHAR (12)	Unique Key	Contact number of the user.
6	address	TEXT(255)	Not Null	Shipping address for deliveries.
7	role	VARCHAR (255)	DEFAULT 'user'	Role of the user (default is 'user').
8	first_name	VARCHAR (255)	Not Null	First name of the user.
9	last_name	VARCHAR (255)	Not Null	Last name of the user.
10	gender	ENUM('male','female')	Not Null	Gender of the user.
11	profile_picture	VARCHAR (255)	Not Null	User's Profile.

10. Table Name: subadmins

Primary Key: subadmin_id

[Table 13: subadmins]

SR NO.	FIELDNAME	DATATYPE(SIZE)	CONSTRAINT	DESCRIPTION
1	subadmin_id	INT(5)	Primary Key	Unique identifier for each sub admin.
2	username	VARCHAR (255)	Unique Key	Username of the user.
3	email	VARCHAR(255)	Unique Key	Email address.
4	password	VARCHAR (255)	Unique Key	Password for securtiy.

CHAPTER-5

TECHNICAL SPECIFICATION

5.1 Hardware Specification:

- **5.1.1 Ram:** 4GB
- **5.1.2 Hard Drive Storage Needed:** 20GB
- **5.1.3 Other Hardware Requirement:** None

5.2 Platform:

- **5.2.1 Supported Operating System:** Windows 10 or above LINUX and MacOS is also compatible.
- **5.2.2 Programmer Server:** PythonAnywhere

5.3 Framework

- **5.3.1 Mark-up Language:** HTML4 and HTML5
- **5.3.2 Programming Language:** Python 3.12.4

5.4 Technical Specification:

- **5.4.1 Front-End:** JavaScript ES6
- **5.4.2 Back-End:** MySQL 8.0
- **5.4.3 IDE Tools:** VS Code
- **5.4.4 UML Tools:** draw.io
- **5.4.5 SRS Tools:** Microsoft Word 2016.

CHAPTER-6

TESTING

6.1 Overview

Testing is a critical component in the software development lifecycle, aimed at identifying and resolving errors to ensure that the system meets its in- tended requirements. For the **Leaf Village**, testing was performed to verify functional accuracy, performance, and overall reliability.

This chapter covers the testing methodologies, techniques used, test cases designed, and results obtained during the testing phase.

6.2 Testing Methods

The testing process incorporated two widely used methodologies:

6.2.1 Black-box Testing

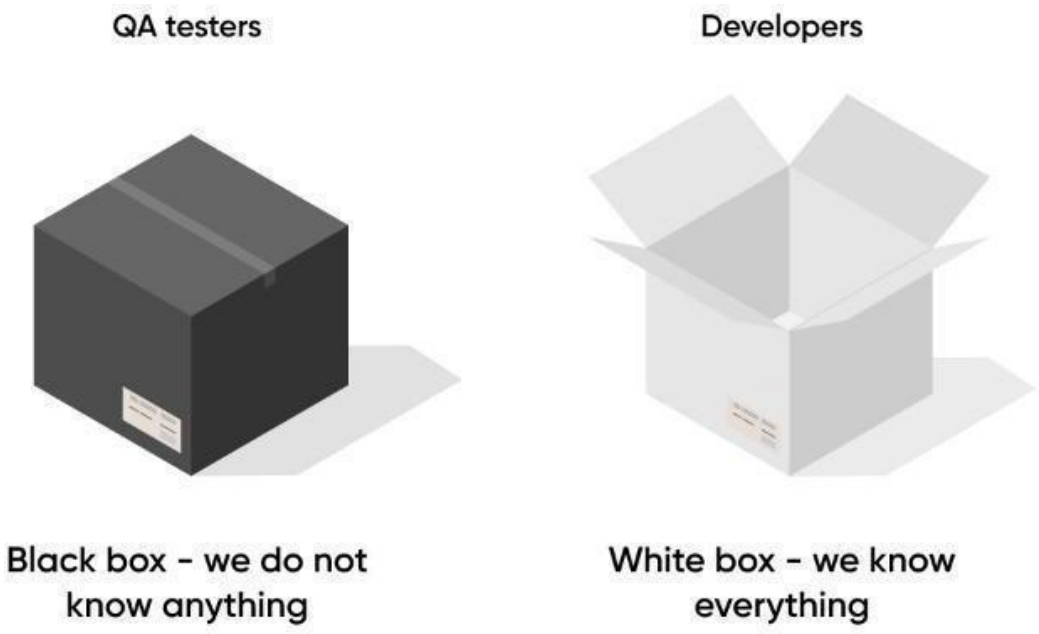
Black-box testing focuses on verifying that the system operates as intended without examining its internal structures or logic. This type of testing en- sures:

- Proper handling of user inputs.
- Accurate generation of expected outputs.
- Integrity of data stored and retrieved from the database.
- Smooth interaction between different modules.

6.2.2 White-box Testing

White-box testing examines the internal workings of the system. It evaluates the implementation logic and ensures:

- All paths within the system are executed at least once.
- Logical conditions are verified for both true and false outcomes.
- Loops are tested to ensure they function correctly under defined boundaries and conditions.



[Figure 19: Testing]

6.3 Testing Techniques Used

To ensure the app worked as expected, we applied the following testing techniques:

1. **Unit Testing** – We tested individual components like login, signup, payment processing, and product upload to ensure they functioned correctly on their own.
2. **Integration Testing** – We verified that different modules (like Hash Password, payment processing, and image storage) worked smoothly together.
3. **UI Testing** – We manually checked buttons, navigation, and layouts to confirm a good user experience across different web pages.
4. **Performance Testing** – We observed website load times and tested how it han- dled multiple requests simultaneously.
5. **Error Handling Testing** – We intentionally caused failures (e.g., network disconnection during payment or product upload) to check if the app displayed proper error messages.
6. **Real Device Testing** – We ran the website on a physical windows device to

check real-world usability.

Tools Used:

- **Visual Studio Code (VS Code)** – Code editor for writing and managing the website's code.
- **Flask** – Web framework for building the website.
- **MySQL** – Database for storing product details and user information.
- **Razorpay** – Payment gateway integration for secure transactions.
- **HTML, CSS, JavaScript**– For front-end development.

6.4 Test Cases and Execution

Detailed test cases were designed to cover all aspects of the system's functionality. Below are examples of test cases:

Test Case 1: User Signup

- **Description:** Verify that a new user can successfully sign up.
- **Input:** Unique email, username, and password.
- **Expected Output:** Account created successfully.
- **Actual Output:** Account created successfully.
- **Status:** ■ Passed

Test Case 2: User Login

- **Description:** Verify that a registered user can log in.
- **Input:** Correct email and password.
- **Expected Output:** User is logged in and redirected to the dashboard.
- **Actual Output:** User is logged in and redirected to the dashboard.
- **Status:** ■ Passed

Test Case 3: Payment

- **Description:** Verify that a payment is processed successfully.

- **Input:** Valid payment details through Razorpay.
- **Expected Output:** Payment is processed, and details are stored.
- **Actual Output:** Payment is processed, and details are stored.
- **Status:** Passed

Test Case 4: Adding product

- **Description:** Verify that subadmin can add new product with no error.
- **Input:** product details like name, price, image etc
- **Expected Output:** Product is added successfully in database
- **Actual Output:** Product is added successfully in database
- **Status:** Passed

Test Case 5: Edit Product

- **Description:** Verifying that the subadmin can edit the details of the product
- **Input:** Edited product details
- **Expected Output:** The edited data of the product is overwritten in the place of existing data
- **Actual Output:** The edited data of the product is overwritten in the place of existing data
- **Status:** Passed

6.5 Results and Observations

The testing process revealed the following outcomes:

- **Account Management:** New user can register or the old user can login with their credentials and the account details can be edited
- **Payment Processing:** Product purchase payments is handled through the Razorpay payment gateway without any major issues user can pay for it via various methods
- **Product Management:** Sub-Admin can Add new products or edit the existing ones seamlessly via their dashboard
- **Admin Supervision:** The Head-Admin (Super-Admin) can overview the activities going on in the website via the dashboard provided the user and Sub-Admin logins and order tracking are possible

➢ Minor inconsistencies in UI elements may occur and data loading and storing may take some time based on connectivity strength of the user
.

6.6 Challenges Encountered

During the testing process, the following challenges were faced:

- **Storing Order history:** We face an issue of retrieving the order history from the Razorpay dashboard after the purchase was a success as the API was a new ground for use
- **UI inconsistencies:** As our web was not as responsive as it should have been we faced a challenge to set the elements of the website properly on different device and screen size with various adjustments
- **Latency:** As the data query is sent to the database executed and then the output is give some tasks took longer than expected to respond to the user input

CONCLUSION

It was a great experience to design and implement the Leaf-Village (Plants and Greenery website) by using Python and to work on its documentation. While working on this project we have learned many things especially how to apply the concept of Python in modelling of real world systems. This project is developed using Python, HTML, CSS, JavaScript and MySQL fully meets the objective of the system which it has been developed. This project is used for easy buying of plants and its tools to maintain and grow various types of herbs. The website allows you to buy plants, tools etc. The website also provides you with a small manual of how to grow and maintain plants, which separates this website from the others.
